

Ajenda Assistant - Run Guide

This guide shows the minimal steps to run the project locally on Windows.

- 1) Install Ollama: <https://ollama.com/download> and pull model (recommended): `ollama pull deepseek-r1:4b`
- 2) Create virtual env and install dependencies: open PowerShell in project root and run `setup.ps1`
- 3) Copy `.env.example` to `.env` and set `API_KEY` and other values.
- 4) Run Ollama on host machine: `ollama run deepseek-r1:4b`
- 5) Start backend: `cd backend; .\venv\Scripts\Activate.ps1; uvicorn main:app --reload --host 0.0.0.0 --port 8000`
- 6) Open `frontend/index.html` in browser. If backend runs on another machine, edit fetch URLs to point to host IP.
